Chapter 1 - The cell

Cells are the basic unit of life. Every living thing is made of one or more cells, and every cell comes from another cell.

Chapter 2 - Cell respiration

Mitochondria produce most of the cell's ATP through oxidative phosphorylation. Glycolysis happens in the cytoplasm and splits glucose into two molecules of pyruvate.

The Krebs cycle runs in the mitochondrial matrix.

Chapter 3 - Membranes

Osmosis moves water across a membrane from low to high solute concentration. Diffusion moves solutes down their gradient.
